

## NSF director inaugurates updated earthquake shake table

The National Science Foundation (NSF) director inaugurated the updated earthquake shake table at the University of California, San Diego (UCSD) on July 14, 2022. The new table, which is the largest and most powerful in the world, is capable of simulating the most intense earthquakes. The table is located in the Jacobs School of Engineering at UCSD and is the result of a \$16 million investment by the NSF. The table is used to test the structural integrity of buildings and other structures under simulated earthquake conditions. The table is a large, rectangular structure that can move in any direction. It is used to test the structural integrity of buildings and other structures under simulated earthquake conditions. The table is a large, rectangular structure that can move in any direction. ## Wastewater provides early detection of SARS-CoV-2 virus

Wastewater analysis provides an early and accurate method for detecting the presence of the SARS-CoV-2 virus in a community. A study published in the journal *Environmental Science & Technology* shows that wastewater analysis can detect the virus before it is widely reported in the community. The study found that wastewater analysis can detect the virus in a community within a few days of its first appearance. This is a significant improvement over traditional methods of detection, which can take weeks or months. The study also found that wastewater analysis can detect the virus in a community even if the virus is not widely reported. This is because wastewater is a common source of the virus, and it is often present in the environment before it is widely reported. The study also found that wastewater analysis can detect the virus in a community even if the virus is not widely reported. This is because wastewater is a common source of the virus, and it is often present in the environment before it is widely reported.

## Mitigating faculty hiring bias through rubrics

A new study from the University of California, San Diego (UCSD) shows that using rubrics can help mitigate bias in faculty hiring. The study, published in the journal *Personnel Psychology*, found that using rubrics can reduce the bias of hiring decisions. The study also found that using rubrics can increase the diversity of the faculty. The study was conducted by a team of researchers from UCSD and the University of Texas at Austin. The researchers used a series of experiments to test the effectiveness of rubrics. They found that using rubrics can reduce the bias of hiring decisions. The study also found that using rubrics can increase the diversity of the faculty. The study was conducted by a team of researchers from UCSD and the University of Texas at Austin. ## US-Mexico student research program breaks record

UCSD students and faculty from the Jacobs School of Engineering and the University of Mexico have broken a record for the number of students participating in a research program. The program, which is a joint effort between the two institutions, has seen a significant increase in participation over the past few years. The program is a joint effort between the two institutions, and it has seen a significant increase in participation over the past few years.
